Of interest regarding the article on page 96:

The California clapper rail (*Rallus longirostris obsoletus*), native to northern and central California, is a different subspecies than the light-footed clapper rail (*Rallus longirostris levipes*), native to southern California and northern Mexico. The light-footed clapper rail is also endangered, with a population of 441 breeding pairs (as of a 2011 survey). Habitat loss is the primary threat to the light-footed clapper rail. Read the 2011 study at <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentVersionID=67053>. PRBO presents further information on the California clapper rail at <http://data.prbo.org/sfstateofthebirds/index.php?page=clapper-rail>.
